Executive Summary

- **Chana Market Supported by MSP Procurement; Demand Remains Sluggish:** Chana prices ended last week with slight firmness as rising government procurement at MSP supported the market amid continued fluctuations. Better parity for Delhi compared to Rajasthan and Madhya Pradesh also helped maintain prices, although demand in chana dal remained weak. Government agencies have reportedly procured over 15,00,000 tonnes of chana across major producing states including Maharashtra, Gujarat, Rajasthan, and Madhya Pradesh. Farmer selling in Maharashtra, Karnataka, and Chhattisgarh remains limited due to lower prices. Trade sources believe increasing procurement may restrict further downside in chana prices in the short term. Around 4,00,000 tonnes of chana is currently lying at Australian ports, while uncertainty continues among stockists due to weak prices and rising storage costs. Market sentiment remains cautious, though prices may gradually improve if demand strengthens during the coming months.
- **Urad Market Flat Amid Tight Supply and Weak Demand:** Urad prices remained mostly steady last week as weak demand in urad dal kept the market in a narrow range despite slow imports from Myanmar and Brazil. Myanmar exported around 49,125 tonnes of urad in April, the lowest level in the last four months, while fresh import deals remained limited due to negative parity and sluggish domestic demand. Summer urad arrivals have started in Jabalpur, Madhya Pradesh, with daily arrivals of around 500–600 quintals and prices ranging between ₹7,500–₹8,100 depending on quality. Weather issues including rainfall, hailstorms, and strong winds have raised concerns over crop quality and disease incidence. Market sources estimate total urad supply in May at only 55,000–60,000 tonnes, much lower than monthly consumption of around 2,00,000 tonnes. Tight supply conditions and limited imports are expected to support the market in the near term.
- **Moong Prices Stable; Rising Arrivals May Pressure Market Ahead:** Moong prices continued to trade in a narrow range as government tender sales fulfilled most domestic demand requirements. NCCF is selling large quantities of Rajasthan kharif moong around ₹7,000, while old stock arrivals in mandis remain negligible. Summer moong arrivals have started in Madhya Pradesh, especially in Khirkiya mandi, where daily arrivals are around 1,000–1,500 quintals with prices ranging between ₹7,000–₹8,000 depending on quality. Initial crop quality is reported to be good, though recent rain and storm activity in parts of Madhya Pradesh has created some concern among farmers. As arrivals increase further, pressure on prices may rise. Market direction will largely depend on government procurement policy, as traders and millers currently prefer buying through government tenders instead of building fresh stocks.
- **Matar Market Steady; Import Pressure Mild Despite Fresh Canada Arrivals:** Desi matar prices remained stable this week across key mandis such as Kanpur, Mahoba, Orai, and Lalitpur, with prices trading in the range of ₹3,700–₹4,300 per quintal amid normal demand and limited fresh activity. Imported matar showed mild weakness, with Canada origin declining by ₹25 and Russia by ₹50 per quintal at Mundra and Hazira ports. International prices of Canada and Russia peas remained steady around $320–325 per tonne. Fresh arrivals are also increasing at ports, with vessel BH Voyage carrying 28,260 tonnes of Canada matar reaching Hazira on May 06, while vessel MV Falcon carrying 17,240 tonnes is expected at Mundra on May 08. Market sentiment remains stable, though higher import costs and global uncertainty are expected to support prices at lower levels.
- **Masoor Market Mixed as MSP Procurement Supports Prices:** Masoor market witnessed a mixed trend last week, with steady demand in small-sized masoor supporting prices, while overall trade remained cautious at higher levels. Government procurement at MSP of ₹7,000 per quintal helped prevent major downside pressure in the domestic market. Small-size masoor prices in Bahraich market of Uttar Pradesh increased by nearly ₹200 per quintal during the week due to firm demand and limited availability. However, global supply remains comfortable as Canada's lentil stocks surged to 23,76,000 tonnes in March 2026, nearly double last year's level. Australia is also estimated to hold around 8,00,000 tonnes of lentil stocks. Domestic port stocks remain low, while farmers are holding back sales expecting better prices through government procurement. Market support is seen in the ₹6,400–₹6,600 range, with stronger upward movement expected only above ₹6,800 levels.
- **Tur Market Firms on Lower Arrivals and Improved Demand:** Tur market witnessed a firm undertone this week as fresh demand in tur dal and declining arrivals in major mandis supported prices. Solapur tur prices increased by nearly ₹100 per quintal, while Akola, Nagpur, Raipur, and Katni bilty markets surged by around ₹200–250 per 100 kg during the week. Arrivals continued to decline across key markets. Amravati arrivals dropped to around 16,000 quintals this week compared to 21,000 quintals last week, while lower arrivals were also reported from Latur, Hinganghat, Malkapur, Khamgaon, and Karnataka markets. Tur imports from Myanmar remained limited in recent weeks, providing additional support to domestic prices. Government agencies have so far procured around 2,50,000 tonnes of tur, while buffer stocks are estimated at around 4,40,000 tonnes. Market sentiment is expected to remain supported due to lower good-quality arrivals and concerns over possible El Niño impact on the upcoming kharif crop.

Tur

- **Below-Normal Rainfall Risk Raises Concerns for Kharif Output and Rural Economy:** India is likely to face below-normal monsoon rainfall in 2026 due to developing El Niño conditions, raising concerns over kharif crop output and rural income stability. The southwest monsoon remains critical, as a large share of agricultural land is still rain-fed and vulnerable to precipitation shocksWhile improved irrigation and climate-resilient practices may cushion the overall production impact, regional disparities remain a key risk. Historically, below-normal rainfall has been associated with weaker agricultural growth and potential inflationary pressures.The bigger risk lies not just in aggregate output but in farmer incomes, particularly for smallholders dependent on rainfall. With additional external pressures such as rising input costs and global supply disruptions, contingency planning and localized drought management strategies will be crucial to mitigate downside risks.
- **Pulses Trading Below MSP Highlights Gaps in Market Intervention Mechanism:** Despite government interventions, pulses in India are reportedly trading below the Minimum Support Price, exposing inefficiencies in procurement and price support systems. MSP is designed to act as a price floor to protect farmer incomes, but its effectiveness varies widely across crops and regions. From an analyst standpoint, weak procurement infrastructure and limited market access are key challenges, forcing farmers into distress sales. Even with policy support, inadequate on-ground implementation reduces the impact of MSP in stabilising prices.This trend signals a structural issue in India's agri-markets—where policy intent does not always translate into effective price realisation. Strengthening procurement systems and improving market linkages will be critical to ensure that MSP truly supports farmer income and production incentives.
- **El Niño Risk Casts Shadow Over Kharif Pulse Outlook:** Weather signals remain a key uncertainty for the 2026–27 agricultural cycle, with forecasts indicating a likely development of El Niño conditions during the southwest monsoon period. Rainfall is projected at around 92% of the long-period average, raising concerns over uneven distribution and potential moisture stress. For pulses, which are largely rain-fed, this introduces significant downside risks. Analysts note that weaker monsoon conditions could impact sowing decisions, reduce yields, and tighten domestic availability. While improved reservoir levels and irrigation expansion may cushion the impact to some extent, the overall outlook remains weather-sensitive. This reinforces the importance of contingency planning, including crop diversification and climate-resilient practices.(Source: PIB)
- **Weak Demand Keeps Pulses Prices Below Support Levels:** Market signals indicate persistent weakness in pulses pricing, with mandi rates in several regions trading below the minimum support threshold due to sluggish demand.This pricing trend reflects a disconnect between supply availability and consumption momentum, which is weighing on farmer realisations. From an analytical perspective, subdued prices could discourage acreage expansion in the upcoming season unless supported by policy incentives or procurement interventions. Additionally, continued price pressure may dampen rural income growth, creating second-order effects on consumption patterns. Overall, the pulses sector is currently navigating a complex mix of policy support, climatic uncertainty, and weak market signals, suggesting a cautiously balanced outlook for the upcoming season.
- **India's Pulses Production Falls Short of Nutritional Needs; Report:** A recent study published in the National Statistics Office journal highlights that India's pulses production is insufficient to meet the nutritional requirements of its population. As per dietary guidelines, a vegetarian adult should consume 85 grams per day, or around 2.55 kilograms per month, but actual consumption across states remains far lower. In many rural regions, intake is significantly below recommended levels, with some states recording less than 0.50 kilograms per month, indicating a major nutrition gap. The report also notes that even if consumption improves to recommended levels, current production levels will not be enough to meet demand. The findings underline the need to boost pulses production, improve awareness about balanced diets, and strengthen food availability to ensure better nutritional security across the country.

Urad

- **India; Government Pushes Faster MSP Procurement of Pulses Amid Weak Market Prices:** The Union Agriculture Ministry has directed NAFED and NCCF to intensify procurement of pulses and oilseeds under the Minimum Support Price (MSP) system as mandi prices in several markets continue to remain below MSP levels. Government agencies have been asked to operate in mission mode and expand procurement activities for key pulse crops such as chana, masoor, and urad. District-wise targets will be finalized based on crop production estimates, market arrivals, and procurement capacity. The Centre has also instructed officials to address operational hurdles and ensure farmers receive payments within 72 hours after procurement. Issues related to delayed payments, state portal integration, and pending procurement data were reviewed during the meeting. The decision comes as weak mandi prices continue to pressure pulse growers across major producing states. The government believes stronger MSP procurement will help support farmer confidence, stabilize markets, and encourage higher pulse production in the coming seasons.
- **Unseasonal Rain Alert Issued Across Maharashtra; Crop Damage Concerns Rise:** The India Meteorological Department (IMD) has issued a weather alert for several parts of Maharashtra, forecasting thunderstorms, lightning, gusty winds, and rainfall over the next few days. Some districts in Marathwada, Madhya Maharashtra, and Vidarbha may also witness hailstorms. Dharashiv and Latur are likely to receive hailstorms, while light rain is expected in Nanded, Hingoli, and Parbhani. Thunderstorm activity is also likely in Solapur, with scattered showers forecast in Kolhapur and Sindhudurg. In Vidarbha, districts including Chandrapur, Gadchiroli, Gondia, and Yavatmal remain under alert.
- **India Summer Pulses Acreage Rises to 23,49,000 Hectares on Higher Urad Sowing:** India's summer pulses acreage increased to 23,49,000 hectares as of May 01, 2026, compared to 22,76,000 hectares during the same period last year, reflecting steady improvement in pulse cultivation. The growth was mainly driven by higher urad sowing, which rose sharply to 4,20,000 hectares from 3,58,000 hectares last year. Farmers are showing increased interest in urad due to favorable market prospects and relatively lower input requirements. Moong acreage remained broadly stable at 18,99,000 hectares, almost unchanged from last year's 19,00,000 hectares. Other pulse crops also recorded marginal gains during the period.
- **Pulses Trading Below MSP Highlights Gaps in Market Intervention Mechanism:** Despite government interventions, pulses in India are reportedly trading below the Minimum Support Price, exposing inefficiencies in procurement and price support systems. MSP is designed to act as a price floor to protect farmer incomes, but its effectiveness varies widely across crops and regions. From an analyst standpoint, weak procurement infrastructure and limited market access are key challenges, forcing farmers into distress sales. Even with policy support, inadequate on-ground implementation reduces the impact of MSP in stabilising prices.This trend signals a structural issue in India's agri-markets—where policy intent does not always translate into effective price realisation. Strengthening procurement systems and improving market linkages will be critical to ensure that MSP truly supports farmer income and production incentives.
- **El Niño Risk Casts Shadow Over Kharif Pulse Outlook:** Weather signals remain a key uncertainty for the 2026–27 agricultural cycle, with forecasts indicating a likely development of El Niño conditions during the southwest monsoon period. Rainfall is projected at around 92% of the long-period average, raising concerns over uneven distribution and potential moisture stress. For pulses, which are largely rain-fed, this introduces significant downside risks. Analysts note that weaker monsoon conditions could impact sowing decisions, reduce yields, and tighten domestic availability. While improved reservoir levels and irrigation expansion may cushion the impact to some extent, the overall outlook remains weather-sensitive. This reinforces the importance of contingency planning, including crop diversification and climate-resilient practices. (Source: PIB)
- **Weak Demand Keeps Pulses Prices Below Support Levels:** Market signals indicate persistent weakness in pulses pricing, with mandi rates in several regions trading below the minimum support threshold due to sluggish demand. This pricing trend reflects a disconnect between supply availability and consumption momentum, which is weighing on farmer realizations. From an analytical perspective, subdued prices could discourage acreage expansion in the upcoming season unless supported by policy incentives or procurement interventions. Additionally, continued price pressure may dampen rural income growth, creating second-order effects on consumption patterns. Overall, the pulses sector is currently navigating a complex mix of policy support, climatic uncertainty, and weak market signals, suggesting a cautiously balanced outlook for the upcoming season.
- **Summer Pulses Sowing Gains Momentum; Urad Sees Strong Growth:** India's summer pulses sowing has shown steady progress up to May 01, 2026, with total area reaching 23,19,000 hectares, compared to 22,58,000 hectares last year, reflecting a gradual increase in acreage. Urad sowing has recorded strong growth, rising to 4,20,000 hectares from 3,58,000 hectares last year. In contrast, moong sowing stands at 18,99,000 hectares, slightly lower than 19,00,000 hectares in the same period last year, indicating stable but marginally weaker coverage. Weekly data shows continuous expansion in both crops, especially from mid-March onwards, supported by favorable conditions. Overall, higher urad acreage is driving the growth in pulses sowing, while moong remains stable. Crop progress in the coming weeks will depend largely on weather conditions and moisture availability.
- **India's Pulses Production Falls Short of Nutritional Needs; Report:** A recent study published in the National Statistics Office journal highlights that India's pulses production is insufficient to meet the nutritional requirements of its population. As per dietary guidelines, a vegetarian adult should consume 85 grams per day, or around 2.55 kilograms per month, but actual consumption across states remains far lower. In many rural regions, intake is significantly below recommended levels, with some states recording less than 0.50 kilograms per month, indicating a major nutrition gap. The report also notes that even if consumption improves to recommended levels, current production levels will not be enough to meet demand. The findings underline the need to boost pulses production, improve awareness about balanced diets, and strengthen food availability to ensure better nutritional security across the country.

Moong

- **India (Madhya Pradesh); Yellow Mosaic Disease Threatens Summer Moong Crop in Harda:** Rising temperatures in Harda district of Madhya Pradesh have increased the risk of yellow mosaic disease in summer moong crop, raising concern among farmers. Agriculture department and Krishi Vigyan Kendra teams have started field visits after reports of infection from several villages. The disease initially appears as yellow spots on leaves and later affects plant growth and yield. Officials stated that the disease mainly spreads through whitefly infestation. Farmers have been advised to remove infected plants immediately and use yellow sticky traps to control whitefly population. Agriculture experts have also asked farmers to regularly monitor crops and seek technical guidance at the early stage to minimize crop losses.
- **Unseasonal Rain Alert Issued Across Maharashtra; Crop Damage Concerns Rise:** The India Meteorological Department (IMD) has issued a weather alert for several parts of Maharashtra, forecasting thunderstorms, lightning, gusty winds, and rainfall over the next few days. Some districts in Marathwada, Madhya Maharashtra, and Vidarbha may also witness hailstorms. Dharashiv and Latur are likely to receive hailstorms, while light rain is expected in Nanded, Hingoli, and Parbhani. Thunderstorm activity is also likely in Solapur, with scattered showers forecast in Kolhapur and Sindhudurg. In Vidarbha, districts including Chandrapur, Gadchiroli, Gondia, and Yavatmal remain under alert.
- **India Summer Pulses Acreage Rises to 23,49,000 Hectares on Higher Urad Sowing:** India's summer pulses acreage increased to 23,49,000 hectares as of May 01, 2026, compared to 22,76,000 hectares during the same period last year, reflecting steady improvement in pulse cultivation. The growth was mainly driven by higher urad sowing, which rose sharply to 4,20,000 hectares from 3,58,000 hectares last year. Farmers are showing increased interest in urad due to favorable market prospects and relatively lower input requirements. Moong acreage remained broadly stable at 18,99,000 hectares, almost unchanged from last year's 19,00,000 hectares. Other pulse crops also recorded marginal gains during the period.
- **Pulses Trading Below MSP Highlights Gaps in Market Intervention Mechanism:** Despite government interventions, pulses in India are reportedly trading below the Minimum Support Price, exposing inefficiencies in procurement and price support systems. MSP is designed to act as a price floor to protect farmer incomes, but its effectiveness varies widely across crops and regions. From an analyst standpoint, weak procurement infrastructure and limited market access are key challenges, forcing farmers into distress sales. Even with policy support, inadequate on-ground implementation reduces the impact of MSP in stabilizing prices. This trend signals a structural issue in India's agri-markets—where policy intent does not always translate into effective price realization. Strengthening procurement systems and improving market linkages will be critical to ensure that MSP truly supports farmer income and production incentives.
- **El Niño Risk Casts Shadow Over Kharif Pulse Outlook:** Weather signals remain a key uncertainty for the 2026–27 agricultural cycle, with forecasts indicating a likely development of El Niño conditions during the southwest monsoon period. Rainfall is projected at around 92% of the long-period average, raising concerns over uneven distribution and potential moisture stress. For pulses, which are largely rain-fed, this introduces significant downside risks. Analysts note that weaker monsoon conditions could impact sowing decisions, reduce yields, and tighten domestic availability. While improved reservoir levels and irrigation expansion may cushion the impact to some extent, the overall outlook remains weather-sensitive. This reinforces the importance of contingency planning, including crop diversification and climate-resilient practices.(Source: PIB)
- **Weak Demand Keeps Pulses Prices Below Support Levels:** Market signals indicate persistent weakness in pulses pricing, with mandi rates in several regions trading below the minimum support threshold due to sluggish demand. This pricing trend reflects a disconnect between supply availability and consumption momentum, which is weighing on farmer realizations. From an analytical perspective, subdued prices could discourage acreage expansion in the upcoming season unless supported by policy incentives or procurement interventions. Additionally, continued price pressure may dampen rural income growth, creating second-order effects on consumption patterns. Overall, the pulses sector is currently navigating a complex mix of policy support, climatic uncertainty, and weak market signals, suggesting a cautiously balanced outlook for the upcoming season.
- **Summer Pulses Sowing Gains Momentum; Urad Sees Strong Growth:** India's summer pulses sowing has shown steady progress up to May 01, 2026, with total area reaching 23,19,000 hectares, compared to 22,58,000 hectares last year, reflecting a gradual increase in acreage. Urad sowing has recorded strong growth, rising to 4,20,000 hectares from 3,58,000 hectares last year. In contrast, moong sowing stands at 18,99,000 hectares, slightly lower than 19,00,000 hectares in the same period last year, indicating stable but marginally weaker coverage. Weekly data shows continuous expansion in both crops, especially from mid-March onwards, supported by favorable conditions. Overall, higher urad acreage is driving the growth in pulses sowing, while moong remains stable. Crop progress in the coming weeks will depend largely on weather conditions and moisture availability.
- **India's Pulses Production Falls Short of Nutritional Needs; Report:** A recent study published in the National Statistics Office journal highlights that India's pulses production is insufficient to meet the nutritional requirements of its population. As per dietary guidelines, a vegetarian adult should consume 85 grams per day, or around 2.55 kilograms per month, but actual consumption across states remains far lower. In many rural regions, intake is significantly below recommended levels, with some states recording less than 0.50 kilograms per month, indicating a major nutrition gap. The report also notes that even if consumption improves to recommended levels, current production levels will not be enough to meet demand. The findings underline the need to boost pulses production, improve awareness about balanced diets, and strengthen food availability to ensure better nutritional security across the country.

Price Influencing Factor(Moong)

Masoor

- **Australia Chickpea and Lentil Exports Decline in March:** Australia's pulse exports weakened during March 2026, with chickpea exports falling to 2,77,650 tonnes from 2,71,20,000 tonnes in February, while lentil exports declined sharply to 85,003 tonnes from 1,74,107 tonnes, according to Australia Bureau of Statistics data. During the current marketing season, Australia's chickpea exports have reached 13,60,000 tonnes, up 26% from last year, while lentil exports increased to 10,40,000 tonnes, registering growth of 45% year-on-year. India and Pakistan remained the major buyers of Australian chickpeas during March, while Bangladesh, Sri Lanka, and Nepal were the leading destinations for lentil exports. The decline in March exports indicates slower shipment activity toward the season-end, although overall annual export performance for both chickpea and lentils remains significantly higher compared to last year.
- **Canada (Saskatchewan); Cold Weather Slows Pulse Seeding:** Cold temperatures, frozen soils, and washed-out roads have slowed seeding progress in Saskatchewan, with overall planting reaching only 3% as of May 04, 2026, compared to the 5-year average of 12%. Among pulse crops, field pea seeding reached 6%, lentils 4%, and chickpeas 3%. Several eastern and northern regions are yet to begin major planting activity. Limited rainfall may help improve field operations ahead, though delayed sowing is being closely monitored by global pulse markets due to Saskatchewan's key role in pea, lentil, and chickpea exports.
- **Canada Pulse Stocks Surge Ahead of 2026-27 Season:** Statistics Canada has reported a sharp rise in pulse stocks as of March 31, 2026, indicating comfortable supply availability ahead of the 2026-27 season. Dry pea stocks increased by 84.7% to 25,05,000 tonnes, while lentil (masoor) stocks surged by 126.7% to 23,76,000 tonnes. Both are significantly above their five-year average levels of 14,00,000 tonnes for peas and 11,00,000 tonnes for lentils. Chana (chickpea) stocks also more than doubled, rising 106.7% to 3,70,000 tonnes. The higher stock levels in Canada may keep global pulse markets well supplied in the coming months and could continue to influence export pricing for key commodities like lentils, yellow peas, and chickpeas in major importing countries including India.
- **Pulses Trading Below MSP Highlights Gaps in Market Intervention Mechanism:** Despite government interventions, pulses in India are reportedly trading below the Minimum Support Price, exposing inefficiencies in procurement and price support systems. MSP is designed to act as a price floor to protect farmer incomes, but its effectiveness varies widely across crops and regions. From an analyst standpoint, weak procurement infrastructure and limited market access are key challenges, forcing farmers into distress sales. Even with policy support, inadequate on-ground implementation reduces the impact of MSP in stabilising prices.This trend signals a structural issue in India's agri-markets—where policy intent does not always translate into effective price realisation. Strengthening procurement systems and improving market linkages will be critical to ensure that MSP truly supports farmer income and production incentives.
- **Weak Demand Keeps Pulses Prices Below Support Levels:** Market signals indicate persistent weakness in pulses pricing, with mandi rates in several regions trading below the minimum support threshold due to sluggish demand. This pricing trend reflects a disconnect between supply availability and consumption momentum, which is weighing on farmer realizations. From an analytical perspective, subdued prices could discourage acreage expansion in the upcoming season unless supported by policy incentives or procurement interventions. Additionally, continued price pressure may dampen rural income growth, creating second-order effects on consumption patterns. Overall, the pulses sector is currently navigating a complex mix of policy support, climatic uncertainty, and weak market signals, suggesting a cautiously balanced outlook for the upcoming season.
- **Hazira Port to Receive 74,326.244 Tonnes Pulses Shipment from Canada:** A major pulses shipment is set to arrive at Hazira port on May 06, 2026, as vessel M.V. BH VOYAGE carries a total of 74,326.244 tonnes from Canada. The cargo includes 46,066.244 tonnes of masoor (lentils) and 28,260 tonnes of yellow peas (matar). The arrival of this large volume is expected to improve domestic availability in the short term, especially in the masoor and yellow pea segments. This may also keep prices under check in the near term, particularly if demand remains moderate.
- **Port Stock Update; Pulses Stocks Rise to 8,40,373 Tonnes Across Major Ports:** Total pulses stock at major ports increased to 8,40,373 tonnes as on April 28, 2026, compared to 7,88,061 tonnes on April 21, reflecting improved availability. Yellow peas stock rose to 3,19,954 tonnes, up from 2,60,633 tonnes last week, with higher arrivals at Mundra and Hazira ports. Red lentils (masoor) stock stood at 1,56,133 tonnes, slightly lower than 1,57,781 tonnes earlier, indicating stable supply. Australia-origin chickpeas stock remained high at 3,64,286 tonnes, though slightly down from previous levels. Overall, increased stocks, especially in yellow peas, suggest comfortable supply at ports, which may keep prices under pressure in the near term unless demand improves.
- **India's Pulses Production Falls Short of Nutritional Needs; Report:** A recent study published in the National Statistics Office journal highlights that India's pulses production is insufficient to meet the nutritional requirements of its population. As per dietary guidelines, a vegetarian adult should consume 85 grams per day, or around 2.55 kilograms per month, but actual consumption across states remains far lower. In many rural regions, intake is significantly below recommended levels, with some states recording less than 0.50 kilograms per month, indicating a major nutrition gap. The report also notes that even if consumption improves to recommended levels, current production levels will not be enough to meet demand. The findings underline the need to boost pulses production, improve awareness about balanced diets, and strengthen food availability to ensure better nutritional security across the country.

India imported 238.28 thousand tonnes of Masoor in Feb 2026, up from 79.68 thousand tonnes during the same month last year.

WPI & Price Inflation(Masoor)

According to the Ministry of Commerce & Industry, The annual rate of inflation of Masoor, based on monthly WPI, stood at 4.5% for the month of December 25 as compared to -0.8% for the corresponding month previous year.

Chana

- **India; Government Pushes Faster MSP Procurement of Pulses Amid Weak Market Prices:** The Union Agriculture Ministry has directed NAFED and NCCF to intensify procurement of pulses and oilseeds under the Minimum Support Price (MSP) system as mandi prices in several markets continue to remain below MSP levels. Government agencies have been asked to operate in mission mode and expand procurement activities for key pulse crops such as chana, masoor, and urad. District-wise targets will be finalized based on crop production estimates, market arrivals, and procurement capacity. The Centre has also instructed officials to address operational hurdles and ensure farmers receive payments within 72 hours after procurement. Issues related to delayed payments, state portal integration, and pending procurement data were reviewed during the meeting. The decision comes as weak mandi prices continue to pressure pulse growers across major producing states. The government believes stronger MSP procurement will help support farmer confidence, stabilize markets, and encourage higher pulse production in the coming seasons.
- **Australia Chickpea and Lentil Exports Decline in March:** Australia's pulse exports weakened during March 2026, with chickpea exports falling to 2,77,650 tonnes from 2,71,20,000 tonnes in February, while lentil exports declined sharply to 85,003 tonnes from 1,74,107 tonnes, according to Australia Bureau of Statistics data. During the current marketing season, Australia's chickpea exports have reached 13,60,000 tonnes, up 26% from last year, while lentil exports increased to 10,40,000 tonnes, registering growth of 45% year-on-year. India and Pakistan remained the major buyers of Australian chickpeas during March, while Bangladesh, Sri Lanka, and Nepal were the leading destinations for lentil exports. The decline in March exports indicates slower shipment activity toward the season-end, although overall annual export performance for both chickpea and lentils remains significantly higher compared to last year.
- **Canada Pulse Stocks Surge Ahead of 2026-27 Season:** Statistics Canada has reported a sharp rise in pulse stocks as of March 31, 2026, indicating comfortable supply availability ahead of the 2026-27 season. Dry pea stocks increased by 84.7% to 25,05,000 tonnes, while lentil (masoor) stocks surged by 126.7% to 23,76,000 tonnes. Both are significantly above their five-year average levels of 14,00,000 tonnes for peas and 11,00,000 tonnes for lentils. Chana (chickpea) stocks also more than doubled, rising 106.7% to 3,70,000 tonnes. The higher stock levels in Canada may keep global pulse markets well supplied in the coming months and could continue to influence export pricing for key commodities like lentils, yellow peas, and chickpeas in major importing countries including India.
- **Pulses Trading Below MSP Highlights Gaps in Market Intervention Mechanism:** Despite government interventions, pulses in India are reportedly trading below the Minimum Support Price, exposing inefficiencies in procurement and price support systems. MSP is designed to act as a price floor to protect farmer incomes, but its effectiveness varies widely across crops and regions. From an analyst standpoint, weak procurement infrastructure and limited market access are key challenges, forcing farmers into distress sales. Even with policy support, inadequate on-ground implementation reduces the impact of MSP in stabilising prices.This trend signals a structural issue in India's agri-markets—where policy intent does not always translate into effective price realisation. Strengthening procurement systems and improving market linkages will be critical to ensure that MSP truly supports farmer income and production incentives.
- **State Push for Pulses Expansion Signals Supply-Side Intervention:** A new policy proposal aimed at boosting pulses production is under consideration, with a focus on increasing farmer incomes and reducing import dependence. The initiative is expected to emphasise productivity enhancement, crop diversification, and improved procurement mechanisms. From a research analyst's standpoint, such targeted interventions indicate a structural push to correct India's long-standing pulses deficit. Given that domestic output has shown volatility in recent years, policy-driven acreage expansion and yield improvement could help stabilise supply. However, execution efficiency —especially in seed distribution, irrigation support, and price assurance—will determine the scheme's effectiveness in translating intent into output gains.
- **Weak Demand Keeps Pulses Prices Below Support Levels:** Market signals indicate persistent weakness in pulses pricing, with mandi rates in several regions trading below the minimum support threshold due to sluggish demand.This pricing trend reflects a disconnect between supply availability and consumption momentum, which is weighing on farmer realisations. From an analytical perspective, subdued prices could discourage acreage expansion in the upcoming season unless supported by policy incentives or procurement interventions. Additionally, continued price pressure may dampen rural income growth, creating second-order effects on consumption patterns. Overall, the pulses sector is currently navigating a complex mix of policy support, climatic uncertainty, and weak market signals, suggesting a cautiously balanced outlook for the upcoming season.
- **Port Stock Update; Pulses Stocks Rise to 8,40,373 Tonnes Across Major Ports:** Total pulses stock at major ports increased to 8,40,373 tonnes as on April 28, 2026, compared to 7,88,061 tonnes on April 21, reflecting improved availability. Yellow peas stock rose to 3,19,954 tonnes, up from 2,60,633 tonnes last week, with higher arrivals at Mundra and Hazira ports. Red lentils (masoor) stock stood at 1,56,133 tonnes, slightly lower than 1,57,781 tonnes earlier, indicating stable supply. Australia-origin chickpeas stock remained high at 3,64,286 tonnes, though slightly down from previous levels. Overall, increased stocks, especially in yellow peas, suggest comfortable supply at ports, which may keep prices under pressure in the near term unless demand improves.
- **India's Pulses Production Falls Short of Nutritional Needs; Report:** A recent study published in the National Statistics Office journal highlights that India's pulses production is insufficient to meet the nutritional requirements of its population. As per dietary guidelines, a vegetarian adult should consume 85 grams per day, or around 2.55 kilograms per month, but actual consumption across states remains far lower. In many rural regions, intake is significantly below recommended levels, with some states recording less than 0.50 kilograms per month, indicating a major nutrition gap. The report also notes that even if consumption improves to recommended levels, current production levels will not be enough to meet demand. The findings underline the need to boost pulses production, improve awareness about balanced diets, and strengthen food availability to ensure better nutritional security across the country.

Pea

- **Canada (Saskatchewan); Cold Weather Slows Pulse Seeding:** Cold temperatures, frozen soils, and washed-out roads have slowed seeding progress in Saskatchewan, with overall planting reaching only 3% as of May 04, 2026, compared to the 5-year average of 12%. Among pulse crops, field pea seeding reached 6%, lentils 4%, and chickpeas 3%. Several eastern and northern regions are yet to begin major planting activity. Limited rainfall may help improve field operations ahead, though delayed sowing is being closely monitored by global pulse markets due to Saskatchewan's key role in pea, lentil, and chickpea exports.
- **Canada (Manitoba); Cold Weather Slows Seeding; Pulse Planting Progress Remains Limited:** Cold temperatures and below-normal rainfall continue to slow seeding activity across Manitoba, with overall planting progress reaching only 2%, compared to 8% last year and the 5-year average of 6%. Field pea planting has started in the Central and Southwest regions, but progress remains limited due to low temperatures and delayed field conditions. Farmers are also waiting for warmer weather before expanding soybean sowing activity. Many areas received little to no rainfall during the week, while temperatures ranged from below freezing to the low 20s°C, affecting crop development and field operations. The delayed planting pace may keep uncertainty over pulse acreage and production outlook in Canada, particularly if cold conditions continue over the coming weeks.
- **Canada Pulse Stocks Surge Ahead of 2026-27 Season:** Statistics Canada has reported a sharp rise in pulse stocks as of March 31, 2026, indicating comfortable supply availability ahead of the 2026-27 season. Dry pea stocks increased by 84.7% to 25,05,000 tonnes, while lentil (masoor) stocks surged by 126.7% to 23,76,000 tonnes. Both are significantly above their five-year average levels of 14,00,000 tonnes for peas and 11,00,000 tonnes for lentils. Chana (chickpea) stocks also more than doubled, rising 106.7% to 3,70,000 tonnes. The higher stock levels in Canada may keep global pulse markets well supplied in the coming months and could continue to influence export pricing for key commodities like lentils, yellow peas, and chickpeas in major importing countries including India.
- **Higher Fertilizer Costs Shift Global Crop Planting Pattern:** Global grain and oilseed markets are closely watching planting progress as rising fertilizer and diesel prices continue to pressure farmers ahead of the 2026 season. According to recent reports, U.S. farmers are expected to reduce corn acreage by 3% to 9,53,00,000 acres, while soybean acreage may increase by 4% to 8,47,00,000 acres due to lower nitrogen requirement and better economics. The rise in input costs has been linked to ongoing geopolitical tensions and disruption in global supply chains. Urea prices have reportedly increased by around 40%, while anhydrous ammonia prices are up nearly 20%. The trend highlights how higher cultivation costs are influencing global crop decisions, with farmers preferring crops requiring lower fertilizer usage. Markets are now expected to focus on weather conditions, planting progress, and export demand in the coming months.
- **Duty-Free Yellow Pea Imports Extended to Stabilize Pulse Supply Dynamics:** India has extended duty-free imports of yellow peas until March 2027, continuing its strategy to manage domestic pulse availability and control food inflation. As the world's largest importer, India sources significant volumes from countries like Canada and Russia. From a market perspective, this move ensures adequate supply in the domestic market, particularly at a time when pulse production and prices remain volatile. However, it also reflects a policy trade-off—while consumers benefit from stable prices, domestic farmers may face pressure from cheaper imports.From an analyst lens, sustained reliance on imports highlights structural gaps in domestic pulse production. Long-term stability will depend on improving yields and aligning procurement policies to balance farmer incentives with consumer affordability.
- **Pulses Trading Below MSP Highlights Gaps in Market Intervention Mechanism:** Despite government interventions, pulses in India are reportedly trading below the Minimum Support Price, exposing inefficiencies in procurement and price support systems. MSP is designed to act as a price floor to protect farmer incomes, but its effectiveness varies widely across crops and regions. From an analyst standpoint, weak procurement infrastructure and limited market access are key challenges, forcing farmers into distress sales. Even with policy support, inadequate on-ground implementation reduces the impact of MSP in stabilizing prices. This trend signals a structural issue in India's agri-markets—where policy intent does not always translate into effective price realization. Strengthening procurement systems and improving market linkages will be critical to ensure that MSP truly supports farmer income and production incentives.
- **Hazira Port to Receive 74,326.244 Tonnes Pulses Shipment from Canada:** A major pulses shipment is set to arrive at Hazira port on May 06, 2026, as vessel M.V. BH VOYAGE carries a total of 74,326.244 tonnes from Canada. The cargo includes 46,066.244 tonnes of masoor (lentils) and 28,260 tonnes of yellow peas (matar). The arrival of this large volume is expected to improve domestic availability in the short term, especially in the masoor and yellow pea segments. This may also keep prices under check in the near term, particularly if demand remains moderate.
- **Port Stock Update; Pulses Stocks Rise to 8,40,373 Tonnes Across Major Ports:** Total pulses stock at major ports increased to 8,40,373 tonnes as on April 28, 2026, compared to 7,88,061 tonnes on April 21, reflecting improved availability. Yellow peas stock rose to 3,19,954 tonnes, up from 2,60,633 tonnes last week, with higher arrivals at Mundra and Hazira ports. Red lentils (masoor) stock stood at 1,56,133 tonnes, slightly lower than 1,57,781 tonnes earlier, indicating stable supply. Australia-origin chickpeas stock remained high at 3,64,286 tonnes, though slightly down from previous levels. Overall, increased stocks, especially in yellow peas, suggest comfortable supply at ports, which may keep prices under pressure in the near term unless demand improves.
